## DETAILED ACTION

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-4<sup>2</sup> are rejected under 35 U.S.C. 102(e) as being anticipated by

Raaijmakers et al. The device structure of the claimed invention is taught by the Raaijmakers reference. For example, the reference teaches the formation of a capacitor structure for use in a DRAM array where the capacitor may be formed with a silicon lower electrode and multiple dielectric layers formed over the silicon electrode, which may be different from each other, as claimed.

For example, Raaijmakers discloses many alternative variations for the multi-dielectric capacitor structure such as shown in FIG. 8 and FIG. 9. Raaijmakers teaches that dielectric materials such as aluminum oxide may be used as first level dielectrics in these capacitors. See, for example, the discussion at col. 4, l.23, col. 6, l. 56, and col. 12, l. 13. In addition, Raaijmakers teaches that additional high-k dielectric layers may also be formed on the first dielectric layer. These second dielectric layers may include metal oxides such as titanium oxide and tantalum oxide (col. 25, l. 30), or hafnium oxide and zirconium oxide (col. 12, l.17).

In addition, Raaijmakers teaches the claimed dimensions for these multiple dielectric layers, for example, at col. 14, l. 32, and shows that these capacitor structures would typically be used in DRAM arrays which inherently incorporate a plurality of word lines, bit lines and integrated capacitors, as shown in FIG. 1B. All of the claimed structural features of the invention are taught by Raaijmakers.
